Devixo Solutions Summer Internship

Week 3 Task: Full Stack Student Management System

Submitted By:	Maria Saeed
Role:	Web Development Intern
Date:	October 25, 2026
Project Type:	Option 1 (HTML, CSS, JavaScript, PHP, MySQL)

1. Project Overview

The objective of this task was to build a complete, database-driven Student Management System. The application provides a secure environment where administrators can manage student records, while standard users have read-only access. The system ensures data permanence using MySQL and features a responsive, interactive dashboard.

2. Technology Stack

- **Frontend:** HTML5, CSS3, JavaScript (Vanilla)
- **Backend:** PHP 8 (Procedural & Object-Oriented using MySQLi)
- **Database:** MySQL (Relational Database)
- **Server:** Apache (via XAMPP)

3. Features Implemented

A. Authentication System

- **Register:** Users can create an account. Passwords are securely hashed using password_hash() in PHP.
- **Login:** Secure login system using PHP Sessions.
- **Logout:** Destroys the session and redirects the user back to the login page.
- **Route Protection:** The dashboard (index.php) cannot be accessed without logging in (redirects to login.html).

B. Student Module (CRUD Operations)

- **Add Student:** Users can add new students to the database via an interactive form.
- **Edit & Update:** Existing records can be modified.

- **Delete:** Records can be safely removed from the database.
- **Search:** A live search feature to filter students by name, email, or course.
- **View Details:** A pop-up modal/alert to view a student's complete profile.

C. Dashboard & UI

- **Statistics Cards:** Dynamically displays Total Students, Recent Registrations, and Active Students fetched directly from the database.
- **Responsive Design:** Fully responsive layout using CSS Media Queries (works perfectly on Mobile, Tablet, and Desktop).
- **Clean UI:** A modern green-themed dashboard with sidebar navigation.

D. Bonus Tasks (Completed)

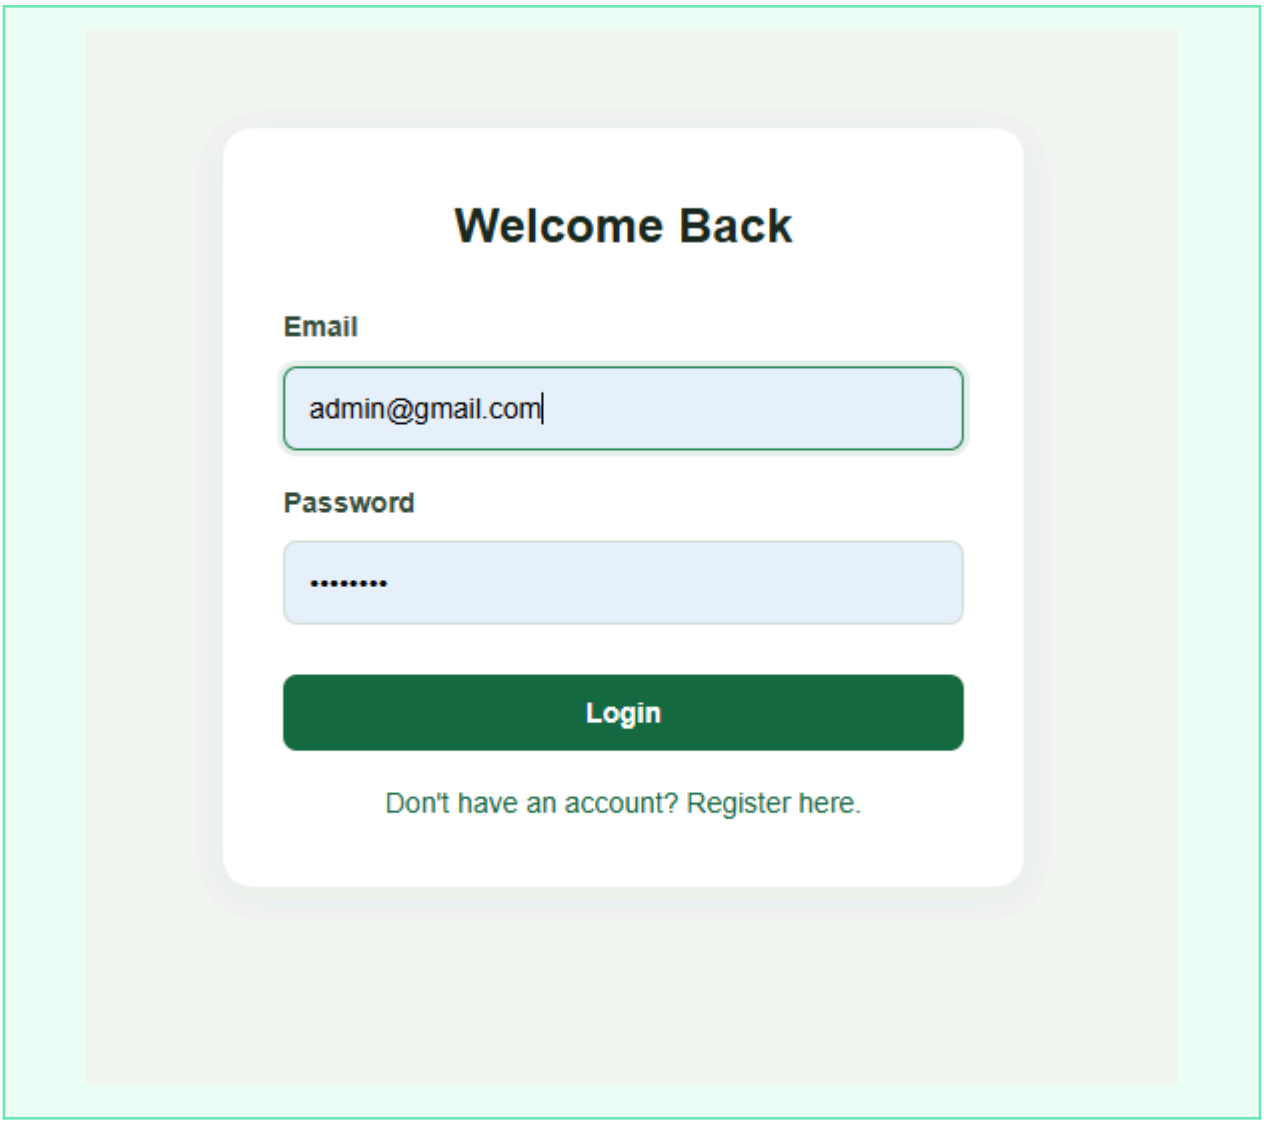

- **1. Pagination:** Student records are paginated (5 records per page) to handle large datasets efficiently.
- **2. Role-Based Access Control:** Admin can Add, Edit, and Delete students. User can only view the data. UI elements like Add, Edit, and Delete buttons are hidden using JavaScript based on the session role.

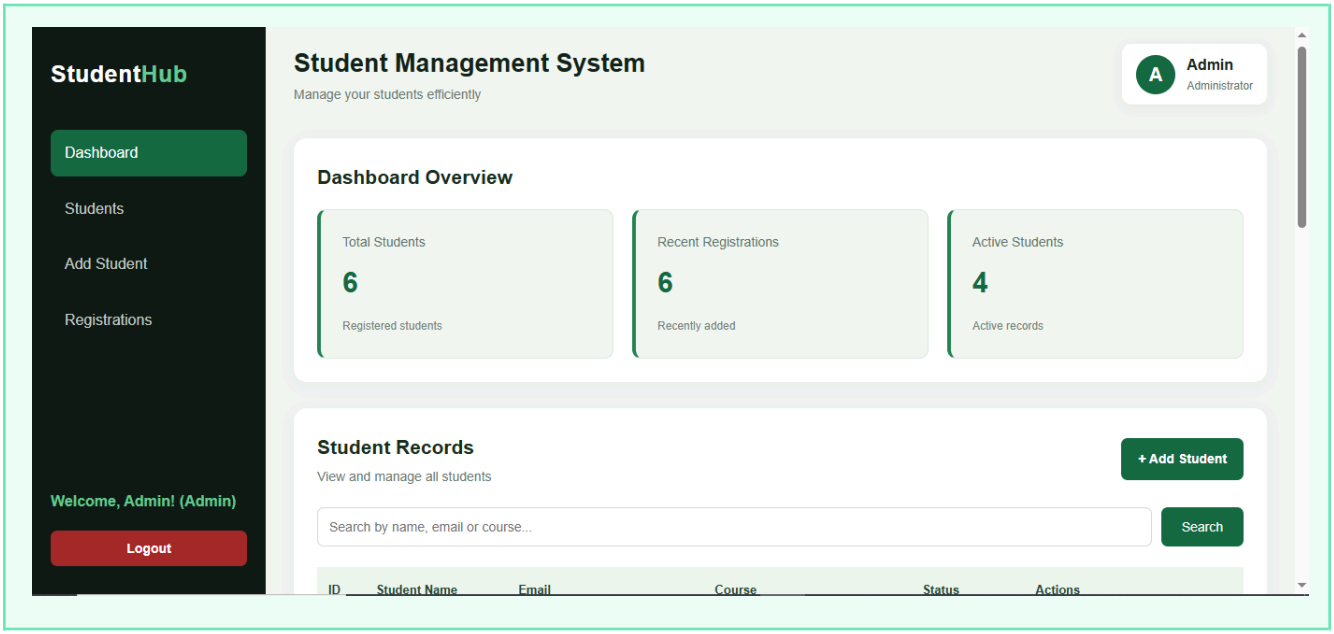

4. Database Schema

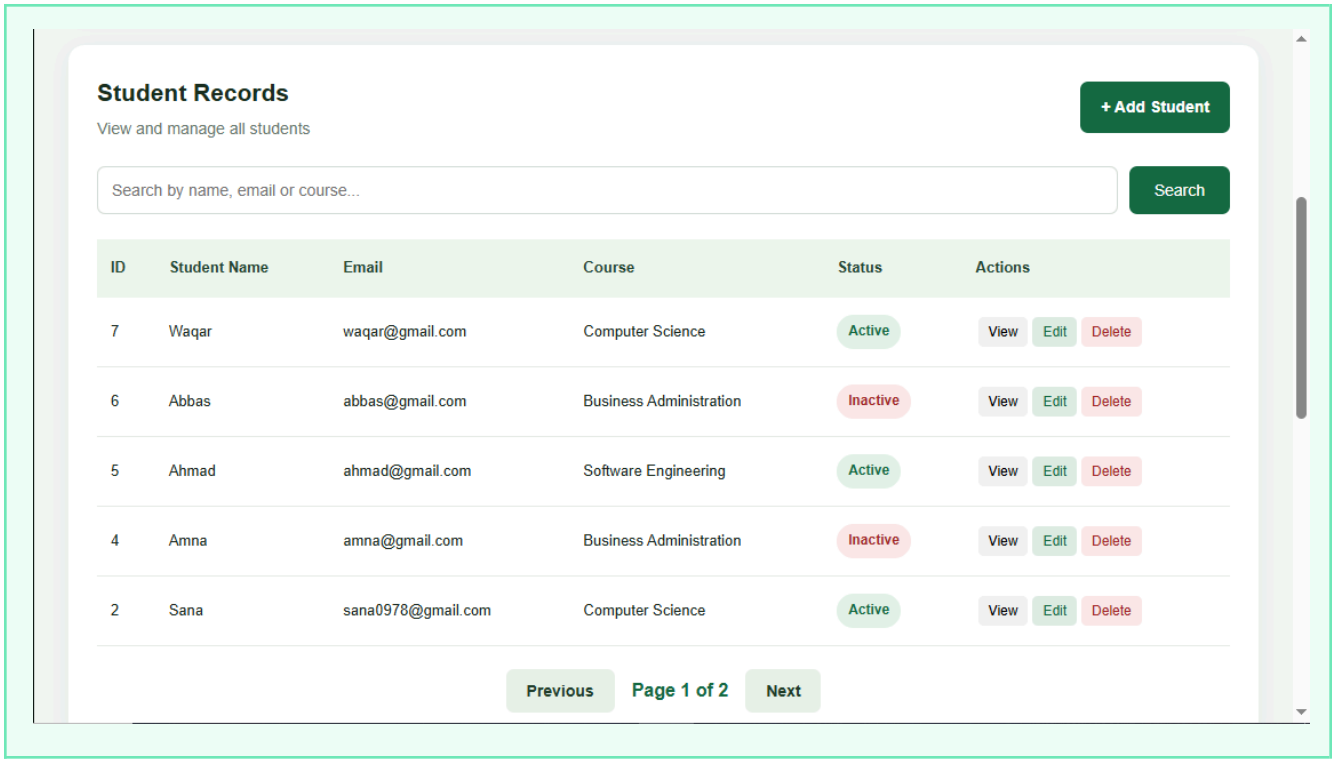

The project uses a MySQL database named student_db with two main tables:

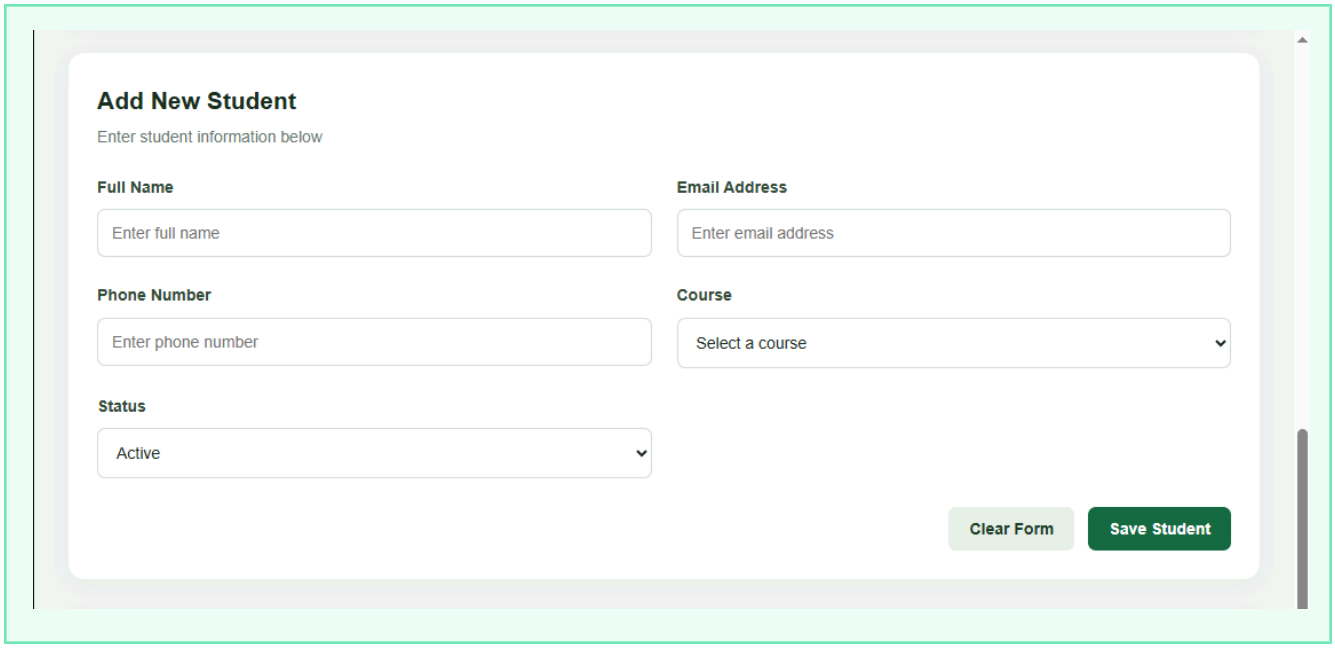

- **1. users Table:** Stores authentication data (id, name, email, password, role).
- **2. students Table:** Stores student data (id, name, email, phone, course, status, created_at).

6. Conclusion

This project successfully meets all the Week 3 task requirements. By building this system from scratch using core PHP and JavaScript, I gained practical experience in database management, session handling, API creation, and building secure, role-based web applications.
